# Only one target: the perfection in dosing.

**The DWS dosing and packaging system** is a machine designed to store pharmaceutical and food powder or granules in different types of packaging (i.e. : drums, bags, tubular liner, etc.).

**The machine is manufactured** according to the most stringent cGMP standards due to the environment in which it works.

**The DWS system is a modular system** composed of a basic machine and a series of options that makes it flexible and easily upgradeable.

**The machine is managed** by a controller located in the power panel where the operating logics, for each phase of the process, are installed. This automation system is able to perform the dosing procedure and the data management related to the batch.

**The human machine interface** is a touch-screen type and it is placed on the operator side in order to make each interaction as comfortable as possible.

**The graphic pages** are user friendly and can be customized according to the customer's specific needs.

**Thanks to the extreme flexibility** of the concept of dosing, that we realize with the DWS, the customer can configure his own solution with the support of the high-level technical staff of Pharma Handling System.
